ON THE LITTLEWOOD-PALEY $g$-FUNCTION AND 
THE LUSIN $s$-FUNCTION

BY

GEORGE GASPER, JR.(1)

1. **Introduction.** Let $F(z)$ be a function regular in the unit disc $|z| < 1$. In their work on Fourier series and power series, Littlewood and Paley [6] introduced the function

$$g(F)(\theta) = \left( \int_0^1 (1-r)|F'(re^{i\theta})|^2 \, dr \right)^{1/2}$$

and proved (although they stated it in a form valid for $p > 1$ only) that if $F \in H^p$, $p > 0$, then

(1.1) \[ \|g(F)\|_p \leq A_p \|F\|_p. \]

The letter $A$ denotes a positive constant which is not necessarily the same at each occurrence and which, except when otherwise stated, depends only on the parameters indicated by subscripts.

In his work on boundary values of regular functions, Lusin [7] introduced the function

$$s(F)(\theta) = \left( \iint_{\Omega(\theta)} |F'(x+iy)|^2 \, dx \, dy \right)^{1/2},$$

where $\Omega(0) = \Omega$ is a standard "kite-shaped" region inside the unit disc with vertex at $z = 1$ and $\Omega(\theta)$ is the region $\Omega$ rotated through an angle $\theta$ around $z = 0$.

Marcinkiewicz and Zygmund [8] proved that if $F \in H^p$, $p > 0$, then

(1.2) \[ \|s(F)\|_p \leq A_{p,\Omega} \|F\|_p. \]

They also demonstrated that $s$ is essentially a majorant of $g$, i.e., $g(F)(\theta) \leq A_\lambda s(F)(\theta)$.

These results were extended to the class $H^p$ in the half-plane by Waterman [15].

Presented to the Society, in part, January 24, 1967 under the title On the functions of Littlewood-Paley and Lusin in the unit n-sphere; received by the editors July 20, 1967.

(1) Supported in part by the National Aeronautics and Space Administration. The author wishes to thank Professor D. Waterman for suggesting the topic and for his encouragement.

The author also wishes to thank Professor R. Askey for observing a simplification at the end of §7. Some of the results obtained in this paper were announced in [4].
zero. This complex variable method does not extend to higher dimensions. However, E. M. Stein [12] has extended these results to functions harmonic in the half-space with boundary values in a class $L^p$, $p > 1$, by utilizing an interpolation theorem of Marcinkiewicz. In 1965, Calderón [3] gave a new proof of (1.2) for the class $H^p$ in the half-plane by applying Green's formula. Also in 1965, Muckenhoupt and Stein [9] extended (1.1), for $p > 1$, to ultraspherical expansions by using both (1.1) and estimates for the differentiated ultraspherical Poisson kernel.

An $H^p$-theory for the unit sphere in $E_n$ can be constructed analogous to that given by E. M. Stein and G. Weiss [13] for the half-space. In this paper we shall present a method which enables us to extend (1.1) and (1.2) to both the class $H^p$ in the unit sphere and the class $H^p$ in the half-space for values of $p$ in a range reaching below 1; namely, $p > (n-2)/(n-1)$, where $n$ is the dimension of the space. In addition, we shall show how our method can be modified in order to extend (1.1) and (1.2) to functions which are harmonic inside the unit sphere (or in the half-space) with boundary values in a class $L^p$, $p > 1$, without using the interpolation theorem of Marcinkiewicz. For the two-dimensional case, our method uses an easily proved inequality instead of the previously mentioned tools. In contrast to Calderón's technique, throughout our calculations no singularities are created by the zeros of $F$ (see [4], where we illustrate the method by presenting a proof of (1.1) for $0 < p \leq 2$). We shall present our results for the unit sphere in Part I ($\S\S 2$–5) and for the half-space in Part II ($\S\S 6$ and 7).

**Part I. Results for the Unit Sphere**

2. Background material and main results. We shall employ the following notation. The vector $x=(x_1, x_2, \ldots, x_n)$ will denote a point in Euclidean $n$-space, $E_n$; $|x|$ denotes the length of the vector $x$, i.e., $|x|=(x_1^2+x_2^2+\cdots+x_n^2)^{1/2}$; $dx$ denotes the element of Euclidean $n$-dimensional volume; $\nabla$ and $\Delta$ denote the gradient and Laplace operators in $E_n$; $\Sigma$ is the open unit sphere, $|x| < 1$, with boundary $\partial\Sigma$, $|x|=1$; $\theta$ denotes a point on $\partial\Sigma$; and $d\theta$ denotes the $(n-1)$-dimensional Euclidean element of volume on $\partial\Sigma$. Thus $x=r\theta$, where $r=|x|$ and $\theta=x/r$. We shall also let $y=(y_1, y_2, \ldots, y_n)$ denote a point in $E_n$ and $\sigma$ denote a point on $\partial\Sigma$. In order to simplify notation, the dependence of general constants on the dimension will not be displayed.

We recall that in cartesian and spherical coordinates:

\begin{equation}
\begin{aligned}
x &= r\theta = (x_1, x_2, \ldots, x_n), \\
x_1 &= r \sin t_1 \sin t_2 \cdots \sin t_{n-2} \sin t_{n-1}, \\
x_2 &= r \sin t_1 \sin t_2 \cdots \sin t_{n-2} \cos t_{n-1}, \\
\vdots \\
x_{n-1} &= r \sin t_1 \cos t_2, \\
x_n &= r \cos t_1,
\end{aligned}
\end{equation}
and \((t_1, t_2, \ldots, t_{n-1})\) belongs to the set
\[
Q = \{(t_1, t_2, \ldots, t_{n-1}) : 0 \leq t_j \leq \pi, j = 1, 2, \ldots, n-2; 0 \leq t_{n-1} < 2\pi\},
\]
(2.2)
\[
dx = r^{n-1} \, dr \, d\theta,
\]
where
\[
d\theta = \sin^{n-2} t_1 \sin^{n-3} t_2 \cdots \sin t_{n-2} \, dt_1 \, dt_2 \cdots dt_{n-1},
\]
(2.3)
\[
|\nabla w|^2 = \sum_{k=1}^{n} \left( \frac{\partial w}{\partial x_k} \right)^2 = \left( \frac{\partial w}{\partial r} \right)^2 + \sum_{j=1}^{n-1} \left( \frac{1}{v_j} \frac{\partial w}{\partial t_j} \right)^2,
\]
and
\[
\Delta w = \sum_{k=1}^{n} \frac{\partial^2 w}{\partial x_k^2} = \frac{1}{v} \frac{\partial}{\partial r} \left( v \frac{\partial w}{\partial r} \right) + \sum_{j=1}^{n-1} \frac{1}{v_j} \frac{\partial}{\partial t_j} \left( v_j \frac{\partial w}{\partial t_j} \right),
\]
where
\[
v = r^{n-1} \sin^{n-2} t_1 \sin^{n-3} t_2 \cdots \sin t_{n-2},
\]
v_1 = r, v_2 = r \sin t_1, \ldots, v_{n-1} = r \sin t_1 \sin t_2 \cdots \sin t_{n-2}.

By \(L^p(\partial \Sigma), p > 0\), we mean the class of functions \(f(\theta)\) whose \(p\)th power is integrable over \(\partial \Sigma\). The norm in \(L^p(\partial \Sigma)\) is defined by
\[
\|f\|_p = \|f(\theta)\|_p = \left( \int_{\partial \Sigma} |f(\theta)|^p \, d\theta \right)^{1/p}.
\]
If \(f \in L^p(\partial \Sigma), p \geq 1\), then its Poisson integral \(u(x), x \in \Sigma\), is given by
\[
u(x) = u(f)(x) = \frac{1}{|\partial \Sigma|} \int_{\partial \Sigma} f(\theta) 1 - \frac{|x|^2}{|\theta - x|^2} \, d\theta,
\]
where \(|\partial \Sigma|\) denotes the \((n-1)\)-dimensional Euclidean volume of \(\partial \Sigma\).

Then \(u(x)\) is harmonic in \(\Sigma\), \(u(x)\) converges to \(f(\theta)\) for almost every \(\theta \in \partial \Sigma\) as \(x\) tends non-tangentially to \(\theta\), \(u(r\theta)\) converges to \(f(\theta)\) in the \(L^p(\partial \Sigma)\) norm as \(r \to 1\), and
\[
\|f\|_p = \lim_{r \to 1} \|u(r\theta)\|_p = \sup_{0 \leq r < 1} \|u(r\theta)\|_p.
\]

As an extension of the notion of a function of one complex variable regular in a region, we use a system of conjugate harmonic functions, i.e., an \(n\)-tuple \(F(x) = (u_1(x), u_2(x), \ldots, u_n(x))\) of real-valued harmonic functions which, in a region, satisfy the generalized Cauchy-Riemann equations
\[
\sum_{j=1}^{n} \frac{\partial u_j}{\partial x_j} = 0, \quad \frac{\partial u_j}{\partial x_k} = \frac{\partial u_k}{\partial x_j}, \quad (2.4)
\]

In the two-dimensional case, it is very well known that \(|F|^p\) is subharmonic whenever \(p > 0\) and, more generally, \(\log |F|\) is subharmonic. For \(n \geq 2\), \(|F(x)|^p\) is subharmonic whenever \(p \geq (n-2)/(n-1)\), as was shown by Stein and Weiss [13]. By employing harmonic majorants of subharmonic functions, they developed the \(H^p\)-theory for the half-space. We shall need analogous results concerning the class \(H^p\) in \(\Sigma\).
If $F(x)$ is a system of conjugate harmonic functions in $\Sigma$, then $F(x)$ is said to belong to the class $H^p(\Sigma)$, $p > 0$, whenever its norm defined by

$$
\|F\|_p = \sup_{0 \leq r < 1} \left( \int_{\partial \Sigma} |F(r\theta)|^p \, d\theta \right)^{1/p}
$$

is finite.

By proceeding as in [13], it can be shown that if $F \in H^p(\Sigma)$, $p > (n-2)/(n-1)$, then the nontangential limit $F(\theta) = (u_1(\theta), u_2(\theta), \ldots, u_n(\theta))$ exists for almost every $\theta \in \partial \Sigma$, $F(r\theta)$ converges to $F(\theta)$ in the $L^p(\partial \Sigma)$ norm as $r \to 1$, and

$$
\|F\|_p = \lim_{r \to 1} \|F(r\theta)\|_p = \|F(\theta)\|_p.
$$

It can be shown that the nontangential limit also exists when $p = (n-2)/(n-1)$. All of the lemmas needed in the proofs are either already known for the sphere or they can be obtained by modifying known results slightly (see Aronszajn and Smith [1], Calderón [2], Privaloff [10], K. T. Smith [11], and de la Vallée Poussin [14]). We shall omit the proofs of these results (the details are contained in the authors dissertation, Wayne State University).

We now define the Littlewood-Paley $g$-function for the unit sphere by

$$
g(f)(\theta) = g(u)(\theta) = \left( \int_0^1 (1-r) |\nabla u(r\theta)|^2 \, dr \right)^{1/2},
$$

$$
g(F)(\theta) = \left( \frac{1}{n} \sum_{j=1}^n g^2(u_j)(\theta) \right)^{1/2}.
$$

For the Lusin $s$-function, the kite-shaped two-dimensional region is replaced by an open cone $\Omega_\delta(\theta)$, $0 < \delta < 1$, consisting of all points in $\Sigma$ which are on line segments joining $\theta$ to $|x| < \delta$.

The Lusin $s$-function for the unit sphere is then defined by

$$
s(f)(\theta) = s(u)(\theta) \left( \int_{\Omega_\delta(\theta)} \frac{|\nabla u(x)|^2}{(1-|x|)^{n-2}} \, dx \right)^{1/2},
$$

$$
s(F)(\theta) = \left( \frac{1}{n} \sum_{j=1}^n s^2(u_j)(\theta) \right)^{1/2}.
$$

When $n=2$, the above definitions are the classical ones. As in the unit disc, $s$ is essentially a majorant of $g$, i.e.,

$$
(2.5) \quad g(f)(\theta) \leq A_\delta s(f)(\theta), \quad g(F)(\theta) \leq A_\delta s(F)(\theta).
$$

These inequalities can easily be obtained by using the fact that $|\nabla u|^2$ is subharmonic and following the argument given by Marcinkiewicz and Zygmund [8] for the case $n=2$. See also Stein [12, p. 447].

Our extensions of (1.1) and (1.2) to the classes $H^p(\Sigma)$ and $L^p(\partial \Sigma)$ are contained in the following two theorems.
Theorem 1. If \( F \in H^p(\Sigma), \) \((n-2)/(n-1) < p < \infty,\) then \( \|g(F)\|_p \leq A_p \|F\|_p \) and \( \|s(F)\|_p \leq A_{p,\delta} \|F\|_p.\)

Theorem 2. If \( f \in L^p(\partial \Sigma), \) \( 1 < p < \infty,\) then \( \|g(f)\|_p \leq A_p \|f\|_p \) and \( \|s(f)\|_p \leq A_{p,\delta} \|f\|_p.\)

The proofs of these theorems will be split into two parts; in §4 we consider the case when \( p \) assumes values \( \leq 2 \) and in §5 we consider the case when \( p > 2. \) In §3 we present our main tools and some basic lemmas.

3. Preliminary lemmas. The first two lemmas are the main tools of our method.

Lemma 1. Let \( c > 0 \) and \( (n-2)/(n-1) < p \leq 2. \) Then, for any system of conjugate harmonic functions \( F(x), \)

\[
2 \sum_{k=1}^{n} |\nabla u_k|^2 = \Delta(\|F\|^2) \leq \frac{2n}{p(pn-p-2)} \left(\|F\|^2 + c\right)^{(2-p)/2} \Delta((\|F\|^2 + c)^{p/2}).
\]

Lemma 2. Let \( c > 0 \) and \( 1 < p \leq 2. \) Then, for any real-valued harmonic function \( u(x), \)

\[
2|\nabla u|^2 = \Delta(u^2) \leq \frac{2}{p(p-1)} (u^2 + c)^{(2-p)/2} \Delta((u^2 + c)^{p/2}).
\]

The Laplacians are nonnegative and, since \( c > 0, \) they exist at each point in the domain of definition of the function \( (F \text{ or } u), \) even those where the function is zero. Hence, there are no singularities to be concerned with at the zeros of the function.

Proof of Lemma 1. In the following calculations, if \( G = (h_1, \ldots, h_n) \) is another vector function, we let

\[
F \cdot G = u_1 h_1 + \cdots + u_n h_n \quad \text{and} \quad G_{x_k} = (\partial h_1/\partial x_k, \ldots, \partial h_n/\partial x_k).
\]

We shall also let \( w(x) = |F(x)|^2 + c. \) It is easy to verify that

\[
\frac{\partial}{\partial x_k} |F|^2 = 2(F \cdot F_{x_k}), \quad \frac{\partial^2}{\partial x_k^2} |F|^2 = 2|F_{x_k}|^2 + 2(F \cdot F_{x_k x_k}),
\]

\[
\frac{\partial^2}{\partial x_k^2} (w^{p/2}) = \frac{p(p-2)}{4} w^{(p-4)/2} \left(\frac{\partial}{\partial x_k} |F|^2\right)^2 + \frac{p}{2} w^{(p-2)/2} \frac{\partial^2}{\partial x_k^2} |F|^2.
\]

Since the components of \( F \) are harmonic, a summation over \( k \) yields

\[
\Delta(w^{p/2}) = p(p-2) w^{(p-4)/2} \sum_{k=1}^{n} (F \cdot F_{x_k})^2 + p w^{(p-2)/2} \sum_{k=1}^{n} |F_{x_k}|^2.
\]

Stein and Weiss [13, p. 34] have shown that

\[
\sum_{k=1}^{n} (F \cdot F_{x_k})^2 \leq \frac{n-1}{n} |F|^2 \sum_{k=1}^{n} |F_{x_k}|^2.
\]
From (3.1) and (3.2), we have 
\[ p(2-p) = 0 \]
\[ p w^{(p-2)/2} \sum_{k=1}^{n} |F_{x_k}|^2 \leq \Delta(w^{p/2}) + p(2-p)(n-1) w^{(p-2)/2} \sum_{k=1}^{n} |F_{x_k}|^2, \]
which reduces to
\[ p(pn-p-n+2) w^{(p-2)/2} \sum_{k=1}^{n} |F_{x_k}|^2 \leq n \Delta(w^{p/2}). \]

Lemma 1 now follows from the above inequality and the observation that
\[ \Delta(|F|^2) = 2 \sum_{k=1}^{n} |F_{x_k}|^2 = 2 \sum_{k=1}^{n} |\nabla u_k|^2. \]

**Proof of Lemma 2.** In the proof of Lemma 1, replace \( F(x) \) by \((u(x), 0, \ldots, 0)\) and use the identity
\[ \sum_{k=1}^{n} \left( u \frac{\partial u}{\partial x_k} \right)^2 = u^2 \sum_{k=1}^{n} \left( \frac{\partial u}{\partial x_k} \right)^2 \]
in place of (3.2).

The next three lemmas are generalizations of some very well-known results of Hardy and Littlewood [5].

**Lemma 3.** For \( f \in L^p(\partial \Sigma), p \geq 1 \), define
\[ M(f)(\theta) = \sup_{|C(\theta, r)|} \frac{1}{|C(\theta, r)|} \int_{C(\theta, r)} |f(\sigma)| \, d\sigma, \]
where the supremum is taken over all spherical caps \( C(\theta, r) = \{ \sigma: |\sigma - \theta| < r \} \) and \( |C(\theta, r)| \) denotes the \((n-1)\)-dimensional volume of \( C(\theta, r) \). If \( p > 1 \), then
\[ \|M(f)\|_p \leq A_p \|f\|_p. \]

**Lemma 4.** Let \( w(x), x \in \Sigma, \) be a nonnegative subharmonic function, and let
\[ N(w)(\theta) = N_{\delta}(w)(\theta) = \sup \{ w(x): x \in \Omega_{\delta}(\theta) \}. \]
If \( p > 1 \), then
\[ \|N(w)\|_p \leq A_{p, \delta} \sup_{0 \leq r < 1} \|w(r\theta)\|_p. \]

**Lemma 5.** Suppose that \( F \in H^p(\Sigma), p > (n-2)/(n-1), \) and let
\[ N(F)(\theta) = N_{\delta}(F)(\theta) = \sup \{ |F(x)|: x \in \Omega_{\delta}(\theta) \}. \]
Then
\[ \|N(F)\|_p \leq A_{p, \delta} \|F\|_p. \]

Lemma 3 is a special case of a theorem proved for more general domains by K. T. Smith [11, Theorem 1]. Lemma 4 can be obtained by a simple modification of the proof which K. T. Smith [11] gave for his Theorem 6. Since \( |F(x)|^p \) is subharmonic whenever \( p \geq (n-2)/(n-1) \), Lemma 5 is an immediate consequence of Lemma 4.
The proofs of Theorems 1 and 2 also require

**Lemma 6.** Suppose that \( F(x) = (u_1(x), \ldots, u_n(x)), x \in \Sigma, \) is an \( n \)-tuple of real-valued harmonic functions (not necessarily satisfying (2.4)). Let

\[
c = c(\delta) = \sup \{ |F(x)|^2 : |x| \leq (\delta + 1)/2 \},
\]

where \( \delta \) is fixed so that \( 0 < \delta < 1 \). If \( p > 0 \) and \( |x| \leq \delta \), then

\[
|\frac{\partial}{\partial r} u_j(x)| \leq |\nabla u_j(x)| \leq A_\delta c^{1/2}, \quad j = 1, 2, \ldots, n
\]

(3.3)

\[
|\frac{\partial}{\partial r}(|F(x)|^2 + c)^{p/2}| \leq A_{p, \delta} c^{p/2},
\]

(3.4)

\[
|\Delta((|F(x)|^2 + c)^{p/2})| \leq A_{p, \delta} c^{p/2}.
\]

(3.5)

**Proof.** Integrating \( \partial u_j / \partial x_k \) over the interior of the sphere with center \( x \) and radius \( R = (1 - \delta)/2 \), applying Green's theorem, and using the mean value property of harmonic functions, we get (3.3). Then (3.4) follows directly from (3.3), and (3.5) follows directly from (3.1) and (3.3).

4. **The cases** \( H^p(\Sigma), (n-2)/(n-1) < p \leq 2, \) **and** \( L^p(\partial \Sigma), 1 < p \leq 2. \) We first present the following:

**Proof of Theorem 1; case when** \( (n-2)/(n-1) < p \leq 2. \) Due to (2.5), it suffices to show that \( \|s(F)\|_p \leq A_{p, \delta} \|F\|_p \).

Let \( F_R(x) = F(Rx), 0 < R < 1. \) If we had the inequality \( \|s(F_R)\|_p \leq A_{p, \delta} \|F_R\|_p \), then, by Fatou's lemma, since \( s(F)(\theta) \leq \lim \inf_{R \to 1} s(F_R)(\theta) \), we would have

\[
\|s(F)\|_p \leq \lim \inf_{R \to 1} \|s(F_R)\|_p \leq \lim_{R \to 1} A_{p, \delta} \|F_R\|_p = A_{p, \delta} \|F\|_p,
\]

the general result. Hence we may assume that \( F(x) \) is a system of conjugate harmonic functions for \( |x| \leq 1 \).

We write

\[
\Omega(\theta) = \Omega_\delta(\theta), \quad s = s(F), \quad d = (\delta + 1)/2, \quad r = |x|,
\]

\[
N(\theta) = \sup_{x \in \Omega_\delta(\theta)} |F(x)|, \quad c = \sup_{|x| \leq d} |F(x)|^2, \quad w(x) = (|F(x)|^2 + c)^{p/2}.
\]

Application of Lemma 1 gives

\[
s^2(\theta) \leq A_p \int_{\Omega(\theta)} \frac{(|F|^2 + c)^{(2-p)/2} \Delta w}{(1-r)^{n-2}} \, dx
\]

\[
\leq A_p N^{2-p}(\theta) \int_{\Omega(\theta)} \frac{\Delta w}{(1-r)^{n-2}} \, dx.
\]

Hence, by Hölder's inequality,

\[
\|s\|_p \leq A_p N \|\Delta w\|_{p/2} \left( \int_{\Omega(\theta)} \int_{\Omega(\theta)} \frac{\Delta w}{(1-r)^{n-2}} \, dx \, d\theta \right)^{1/2}.
\]

(4.1)
An elementary argument shows that if $\chi_\delta(x)$ is the characteristic function of $\Omega(\theta)$ and

$$J_r = \int_{\partial \Sigma} \chi_\delta(r \sigma) \, d\theta,$$

then

$$J_r \leq A_\delta(1-r)^{n-1}. \tag{4.2}$$

Applying (4.2), we have

$$\int_{\partial \Sigma} \int_{\Omega(\theta)} \frac{\Delta w}{(1-r)^{n-2}} \, dx \, d\theta = \int_{\partial \Sigma} \int \frac{\chi_\delta(x) \, \Delta w}{(1-r)^{n-2}} \, dx \, d\theta = \int_{\partial \Sigma} \frac{J_r \, \Delta w}{(1-r)^{n-2}} \, dx$$

$$\leq A_\delta \int_{\partial \Sigma} \int_0^1 (1-r) \, \Delta w(r \theta) \, dr \, d\theta = A_\delta \| G^2_\rho \|_1,$$

where

$$G^2_\rho(\theta) = \int_0^1 (1-r) \, \Delta w(r \theta) \, dr.$$

We prove now that

$$\| G^2_\rho \|_1 \leq A_{p,\rho} \| N \|_p. \tag{4.4}$$

Letting

$$G^2_\rho(\theta) = \int_0^\delta + \int_\delta^1 = I^2_1 + I^2_2$$

reduces the proof of (4.4) to showing that

$$\| I^2_k \|_1 \leq A_{p,\rho} \| N \|_p, \quad k = 1, 2. \tag{4.5}$$

By Lemma 6 and the observation that $c \leq N^2(\theta)$ for all $\theta$, we get

$$\| I^2_1 \|_1 \leq A_{p,\rho} \left\| \int_0^\delta (1-r)c^{p/2} \, dr \right\|_1 \leq A_{p,\rho} \| N \|_p,$$

which gives (4.5) for $I_1$.

For $I_2$, we use (2.3) to write

$$I^2_2 = \int_0^1 \frac{1-r}{v} \frac{\partial}{\partial r} \left( v \frac{\partial w}{\partial r} \right) \, dr + \sum_{j=1}^{n-1} \int_\delta^1 \frac{1-r}{v} \frac{\partial}{\partial t_j} \left( v \frac{\partial w}{v_j} \frac{\partial}{\partial t_j} \right) \, dr$$

$$= P + \sum_{j=1}^{n-1} P_j. \tag{4.6}$$

Let us first consider $P$. Integrating by parts ($F$ being a system of conjugate harmonic functions for $|x| \leq 1$) and applying Lemma 6, we obtain

$$P = \int_\delta^1 \frac{1-r}{r^{n-1}} \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial w}{\partial r} \right) \, dr$$

$$= \left[ \frac{1}{r} \frac{\partial w}{\partial r} \right]_\delta^1 + \left[ (2-n+\frac{n-1}{r}) \frac{w}{r^{n-1}} \right]_\delta^1 + (n-1) \int_\delta^1 w \, r^2 \, dr$$

$$\leq A_{p,\rho} N^p. \tag{4.7}$$
For $P_j$, an integration with respect to $t_j$ shows that ($Q$ as defined in (2.1))

$$\int_{\partial \Sigma} P_j(\theta) \, d\theta = \int_Q \int_0^1 \left( \frac{1-r}{r^{n-1}} \frac{\partial}{\partial t_j} \left( \frac{v}{v_j^2} \frac{\partial w}{\partial t_j} \right) \right) \, dt_1 \cdots dt_{n-1} = 0,$$

because

$$\left[ \sin^{n-j-1} t_j \frac{\partial w}{\partial t_j} \right]_{t_j=0}^{t_j=\pi} = 0, \quad j < n-1,$$

and, due to periodicity,

$$\left[ \frac{\partial w}{\partial t_{n-1}} \right]_{t_{n-1}=0}^{t_{n-1}=2\pi} = 0.$$

Combining (4.6), (4.7), and (4.8), we get

$$\int_{\partial \Sigma} P^2_j(\theta) \, d\theta \leq A_{p,\delta} \| N \|_p^p,$$

which gives (4.5) for $I_2$. This concludes the proof of (4.4).

From (4.1), (4.3), (4.4), and Lemma 5, we get

$$\| s \|_2 \leq A_{p,\delta} \| N \|_p^{(2-p)/2} \| G^2 \|_1^{1/2} \leq A_{p,\delta} \| N \|_p \leq A_{p,\delta} \| F \|_p,$$

the desired result.

**Proof of Theorem 2; case when $1 < p \leq 2$.** The proof here runs along essentially the same lines as the above. We replace Lemma 1 by Lemma 2 and Lemma 5 by Lemma 4 with $w(x) = |u(f)(x)|$.

5. **Theorems 1 and 2; case when $p > 2$.** The following lemma enables us to derive the inequalities in Theorems 1 and 2 involving the $s$-function from those for the $g$-function when $p \geq 2$.

**Lemma 7.** If $p \geq 2$ and $u(x)$ is a function harmonic in $\Sigma$, then

$$\| s(u) \|_p \leq A_{p,\delta} \| g(u) \|_p.$$

**Proof.** Let $s = s(u)$ and $g = g(u)$. We may write

$$\| s \|_p^p = \left( \int_{\partial \Sigma} s^2(\theta) \, d\theta \right)^{p/2} \sup_h \int_{\partial \Sigma} s^2(\theta) h(\theta) \, d\theta,$$

the supremum being taken over all nonnegative functions $h(\theta)$ which satisfy $\| h \|_q \leq 1$, where $1/(p/2) + 1/q = 1$.

Then, using (4.2), Lemma 3, and the notation associated with them, we have

$$\int_{\partial \Sigma} s^2(\theta) h(\theta) \, d\theta = \int_{\partial \Sigma} \int_{\Sigma} \frac{h(\theta)\chi_\delta(x)}{(1-r)^{n-2}} | \nabla u(x) |^2 \, dx \, d\theta$$

$$\leq A_\delta \int_{\Sigma} \int_{\partial \Sigma} \frac{1}{(1-r)^{n-2}} ( \int_{\partial \Sigma} h(\theta) \chi_\delta(r) \, d\theta ) \, dx$$

$$\leq A_\delta \int_{\Sigma} \int_{\partial \Sigma} (1-r)^{-2} | \nabla u(x) |^2 M(h)(\sigma) \, dx$$

$$\leq A_\delta \| g \|_p^p \| M(h) \|_q \leq A_{p,\delta} \| g \|_p^p \| h \|_q \leq A_{p,\delta} \| g \|_p^p,$$

which, with (5.2), yields (5.1).
We also need the next lemma, which contains generalizations of some well-known inequalities that were employed by Littlewood and Paley [6, II]. Since the proof is a relatively direct and tedious modification of that sketched for Lemma 6, it is omitted.

**Lemma 8.** Suppose that \( F(x) \) is a system of conjugate harmonic functions in \( \Sigma \). Let

\[
c = \sup_{|x| \leq 1/2} |F(x)|^2 \quad \text{and} \quad N(\theta) = N(F)(\theta) = \sup_{x \in \Omega_{1/2}(\theta)} |F(x)|.
\]

If \((n - 2)/(n - 1) < p \leq 2\) and \( x = r^{\theta}, \) then \((j, k = 1, 2, \ldots, n)\)

\[
(5.6) \quad |\nabla((|F(x)|^2 + c)^{p/2})| \leq A_p N^{p/2}(\theta) [\Delta((|F(x)|^2 + c)^{p/2})]^{1/2},
\]

\[
(5.7) \quad |\nabla[\Delta((|F(x)|^2 + c)^{p/2})]| \leq A_p N^{p/2}(\theta) [\Delta((|F(x)|^2 + c)^{p/2})]^{1/2}/(1 - r)^2.
\]

We now complete the proofs of Theorems 1 and 2.

**Proof of Theorem 1; case when** \( p > 2 \). In view of Lemma 7 and the inequalities

\[
s(F) \leq \sum_{k=1}^{n} s(u_k), \quad g(u_k) \leq n^{1/2} g(f),
\]

it is enough to prove that

\[
(5.8) \quad \|g(F)\|_p \leq A_p \|F\|_p.
\]

Moreover, due to an observation made in §4, we may assume that \( F(x) \) is a system of conjugate harmonic functions for \( |x| \leq 1 \).

Letting

\[
g^2(F)(\theta) = \int_0^{1/4} + \int_{1/4}^{1} = I_1^2 + I_2^2
\]

reduces the problem to showing that

\[
(5.9) \quad \|I_j\|_p \leq A_p \|F\|_p, \quad j = 1, 2.
\]

Let \( c \) and \( N(\theta) \) be defined as in Lemma 8. Then, by (5.3) and Lemma 5,

\[
\|I_1\|_p \leq A_p \|N\|_p \leq A_p \|F\|_p,
\]

which gives (5.9) for \( I_1 \).
In proving (5.9) for \( I_2 \), we shall follow a procedure which is closely akin to that employed by Littlewood and Paley [6, II, pp. 60–63] for their \( g \)-function when \( p \) is an even integer.

Let us first consider the special case \( 2 < p \leq 4 \) (actually the following argument is valid for the wider range \( (2n-4)/(n-1) < p \leq 4 \)). Application of Lemma 1 with \( p \) replaced by \( p/2 \) and \( w(r\theta) = (|F(r\theta)|^2 + c)^{p/4} \) gives

\[
\| I_2 \|_p \leq A_p \left( \int_{\mathbb{R}^2} N^{p(4-p)/4} \left( \int_{1/4}^1 (1-r) \Delta w \, dr \right)^{p/2} \, d\theta \right)^{1/p}
\]

\[
\leq A_p \left\| N \right\|_p^{(4-p)/4} \left( \int_{1/4}^1 (1-r) \Delta w \, dr \right)^{1/2},
\]

since \((4-p)/4 + p/4 = 1\). Writing \( w_m = w(r_m, \theta), m = 1, 2\), we see that

\[
\left\| \int_{1/4}^1 (1-r) \Delta w \, dr \right\|_2^2 = 2 \int_{\mathbb{R}^2} \int_{1/4}^1 \int_{r_2}^1 (1-r_1)(1-r_3) \Delta w_1 \Delta w_2 \, dr_1 \, dr_2 \, d\theta.
\]

Substituting for \( \Delta w_1 \) its form in spherical coordinates (using the notation in (2.3) with \( r_1, r_2 \)) and observing that, due to Lemma 8,

\[
\int_{r_2}^1 \frac{1-r}{r^{n-1}} \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial w}{\partial r} \right) \, dr = \left[ (1-r) \frac{\partial w}{\partial r} \right]_{r_2}^1 + \left[ \left( 2-n+\frac{n-1}{r} \right) w \right]_{r_2}^1 + (n-1) \int_{r_2}^1 \frac{w}{r^2} \, dr \leq A_p N^{p/2}
\]

whenever \( 1/4 \leq r_2 \leq 1 \), we obtain

\[
\left\| \int_{1/4}^1 (1-r) \Delta w \, dr \right\|_2^2 \leq A_p \int_{\mathbb{R}^2} \int_{1/4}^1 (1-r_3) N^{p/2} \Delta w_2 \, dr_2 \, d\theta + 2 \sum_{j=1}^{n-1} \int_{\mathbb{R}^2} \int_{1/4}^1 \int_{r_2}^1 (1-r_1)(1-r_3) \Delta w_2 \times \frac{1}{v_j} \frac{\partial}{\partial t_j} \left( \frac{v_j}{v^2} \frac{\partial w_1}{\partial t_j} \right) \, dr_1 \, dr_2 \, d\theta
\]

\[
= P + \sum_{j=1}^{n-1} P_j.
\]

Then, using Hölder’s inequality,

\[
P \leq A_p \left\| N \right\|_p^{p/2} \left\| \int_{1/4}^1 (1-r) \Delta w \, dr \right\|_2.
\]

Also, an integration by parts with respect to \( t_j \) yields

\[
P_j = -2 \int_{\mathbb{R}^2} \int_{1/4}^1 \int_{r_2}^1 (1-r_1)(1-r_3) \frac{1}{v_j^2} \left( \frac{\partial}{\partial t_j} \Delta w_2 \right) \frac{\partial w_1}{\partial t_j} \, dr_1 \, dr_2 \, d\theta.
\]
Therefore, using (5.6) and (5.7) with \( p \) replaced by \( p/2 \),

\[
P_j \leq A_p \int_{\partial \Sigma} \int_{1/4}^{1} \int_{r_2}^{1} \left( \frac{1-r_1}{1-r_2} \right)^{N^{p/2}(\Delta w_1)^{1/2}(\Delta w_2)^{1/2}} dr_1 \, dr_2 \, d\theta
\]

\[
\leq A_p \int_{\partial \Sigma} N^{p/2} \int_{1/4}^{1} \int_{r_2}^{1} \left[ \Delta w_2 + \left( \frac{1-r_1}{1-r_2} \right)^2 \Delta w_1 \right] \, dr_1 \, dr_2 \, d\theta
\]

\[
= A_p \int_{\partial \Sigma} N^{p/2} \left\{ \int_{1/4}^{1} \left( \frac{dr_2}{(1-r_2)^2} \right) dr_1 \right\} \, d\theta
\]

\[
\leq A_p \int_{\partial \Sigma} N^{p/2} \left( \int_{1/4}^{1} (1-r) \Delta w \, dr \right) \, d\theta
\]

(5.13)

\[
\leq A_p \int_{\partial \Sigma} N^{p/2} \left( \int_{1/4}^{1} (1-r) \Delta w \, dr \right) \, d\theta
\]

From (5.11), (5.12), and (5.13), we get

\[
\left\| \int_{1/4}^{1} (1-r) \Delta w \, dr \right\|_2 \leq A_p \int_{\partial \Sigma} N^{p/2}
\]

and so, due to (5.10) and Lemma 5,

\[
\left\| I_2 \right\|_p \leq A_p \left\| N \right\|_{p/2}^{p^{4}/p^{4}} \left\| N \right\|_{p/2}^{p^{4}} \leq A_p \left\| F \right\|_p, \quad 2 < p < 4.
\]

For the case when \( 2(k-1) < p \leq 2k, k=2, 3, \ldots, \) application of Lemma 1 with \( p \) replaced by \( p/k, c \) defined as above, and \( w(r\theta) = (|F(r\theta)|^2 + c)^{p/2k} \) gives

(5.14)

\[
\left\| I_2 \right\|_p \leq A_p \left\| N \right\|_{p/k}^{(2k-p)/2k} \left\| \int_{1/4}^{1} (1-r) \Delta w \, dr \right\|_k^{1/2}
\]

since \( (2k-p)/2k + p/2k = 1 \).

Writing \( w_m = w(r_m \theta), m=1, 2, \ldots, k, \) we see that

\[
\left\| \int_{1/4}^{1} (1-r) \Delta w \, dr \right\|_k^k = A_k \int_{\partial \Sigma} \int_{1/4}^{1} \Delta w \, dr_1 \, dr_2 \, d\theta
\]

Now we substitute for \( \Delta w_1 \) its form in spherical coordinates and notice that, just as in (5.12), the integral containing the partials with respect to \( r_1 \) is not greater than

\[
A_p \left\| N \right\|_{p/k} \left\| \int_{1/4}^{1} (1-r) \Delta w \, dr \right\|_k^{k-1}
\]

Next, as in the case \( k=2 \), the integral (\( j \) considered fixed)

\[
\int_{\partial \Sigma} \int_{1/4}^{1} \Delta w \, dr_1 \, dr_2 \, d\theta
\]

is integrated by parts with respect to \( t_j \) in order to show that it equals

\[
-\int_{\partial \Sigma} \int_{1/4}^{1} \frac{v_j^2}{1-r_1} \, dr_1 \, dr_2 \, d\theta.
\]
Then we substitute
\[ \frac{\partial}{\partial t_j} \left( \prod_{i=2}^{k} \Delta w_{m_i} \right) = \sum_{i=2}^{k} \frac{\partial \Delta w_{m_i}}{\partial t_j} \left( \prod_{m \neq i}^{k} \Delta w_{m_i} \right) \]
into the above integral and consider the term \((i \text{ and } j \text{ considered fixed})\)

Applying Lemma 8 with \(p\) replaced by \(p/k\) and proceeding as in (5.13), we find

\[ - \int_{\partial \Sigma} \int_{1/4 \leq \cdots \leq r_i \leq 1} \cdots \int v_j^{-2} \prod_{1}^{k} (1 - r_m) \frac{\partial \Delta w_{m_i}}{\partial t_j} \prod_{m \neq i}^{k} \Delta w_{m_i} \prod_{1}^{k} d r_m \ d \theta. \]

Applying Lemma 8 with \(p\) replaced by \(p/k\) and proceeding as in (5.13), we find
that this term is less in absolute value than

\[ A_p \int_{\partial \Sigma} N^{p/k} \int_{1/4 \leq \cdots \leq r_i \leq 1} \cdots \int \left( \frac{1 - r_i}{1 - r_i} \right) (\Delta w_{1}^{1/2}(\Delta w_{i})^{1/2} \prod_{m \neq i}^{k} (1 - r_m) \Delta w_{m_i} \prod_{1}^{k} d r_m \ d \theta \]

\[ \leq A_p \int_{\partial \Sigma} N^{p/k} \left( \int_{0 \leq r_1 \leq 1} \left( \frac{1 - r_1}{1 - r_1} \right) (\Delta w_{1}^{1/2}(\Delta w_{1})^{1/2} dr_1 \right) \]

\[ \cdot \left( \int_{0 \leq \cdots \leq r_i + 1 \leq \cdots \leq r_{i-1} \leq \cdots \leq r_2 \leq 1} \cdots \int \prod_{m \neq i}^{k} (1 - r_m) \Delta w_{m_i} \prod_{m \neq i}^{k} dr_m \right) d \theta \]

\[ \leq A_p \int_{\partial \Sigma} N^{p/k} \left( \int_{1/4}^{1} (1 - r) \Delta w \ dr \right)^{k-1} d \theta \]

\[ \leq A_p \| N \|^{p/k} \| \int_{1/4}^{1} (1 - r) \Delta w \ dr \|^{k-1} \]

Combining these estimates, we obtain

\[ \left\| \int_{1/4}^{1} (1 - r) \Delta w \ dr \right\|^{k} \leq A_p \| N \|^{p/k}, \]

and so, from (5.14),

\[ \left\| I_2 \right\|_{p} \leq A_p \| N \|^{(2k-p)/2k} \| N \|^{p/2k} \leq A_p \| F \|_{p}, \]

which gives (5.9) for \(I_2\). This completely proves Theorem 1.

**Proof of Theorem 2; case when \(p > 2\).** In the above proof, replace the lemmas
regarding systems of conjugate harmonic functions by the analogous results for a
single harmonic function.

**Part II. Results for the half-space**

**6. Background material and main results.** For points in \(E_n\) we shall continue
to use the notation introduced in §2, unless otherwise stated. A point in the half-
space, \(E_n \times (0, \infty)\), will be denoted by \((x; t) = (x_1, \ldots, x_n; t)\), where \(t > 0; \ |(x; t)| = (x_1^2 + \cdots + x_n^2 + t^2)^{1/2} \); and \(\nabla\) and \(\Delta\) denote the gradient and Laplace operators in
\(E_{n+1}^+\).
By $L^p(E_n)$, $p > 0$, we mean the class of functions $f(x)$ whose $p$th power is integrable over $E_n$. The norm in $L^p(E_n)$ is defined by

$$
\|f\|_p = \|f(x)\|_p = \left(\int_{E_n} |f(x)|^p \, dx\right)^{1/p}.
$$

If $f \in L^p(E_n)$, $p \geq 1$, then its Poisson integral $u(x; t)$, $t > 0$, is given by

$$
u(x; t) = u(f)(x; t) = \pi^{-(n+1)/2} (n+1)/2 \int_{E_n} \frac{f(x-y) \, dy}{|y|^2 + t^2}^{(n+1)/2}.
$$

Then $u(x; t)$ is harmonic in $E_n \times (0, \infty)$, $f(x) = \lim_{t \to 0} u(x; t)$ both in the $L^p(E_n)$ norm and almost everywhere, and $\|f\|_p = \lim_{t \to 0} \|u(x; t)\|_p = \sup_{t > 0} \|u(x; t)\|_p$.

A system of conjugate harmonic functions in the half-space is an $(n+1)$-tuple $F(x; t) = (u_1(x; t), \ldots, u_{n+1}(x; t))$ of real-valued harmonic functions satisfying, in $t > 0$, the generalized Cauchy-Riemann equations

$$
\frac{\partial u_{n+1}}{\partial t} + \sum_{j=1}^n \frac{\partial u_j}{\partial x_j} = 0, \quad \frac{\partial u_{n+1}}{\partial x_j} = \frac{\partial u_j}{\partial t} = \frac{\partial u_k}{\partial x_j},
$$

where $j, k = 1, 2, \ldots, n$. Since $F(x; t)$ has $(n+1)$-components, $|F(x; t)|^p$ is subharmonic whenever

$$p \geq \frac{n - 1}{n} = \frac{(n+1) - 2}{(n+1) - 1}.
$$

If $F(x; t)$ is a system of conjugate harmonic functions in the half-space, then $F(x; t)$ is said to belong to the class $H^p(E_n \times (0, \infty))$, $p > 0$, whenever its norm defined by

$$
\|F\|_p = \sup_{0 < t < \infty} \left(\int_{E_n} |F(x; t)|^p \, dx\right)^{1/p}
$$

is finite.

Stein and Weiss [13] have shown that if $F \in H^p(E_n \times (0, \infty))$, $p > (n-1)/n$, then the nontangential limit $F(x; 0) = (u_1(x; 0), \ldots, u_{n+1}(x; 0))$ exists for almost every $x \in E_n$, $F(x; t)$ converges to $F(x; 0)$ in the $L^p(E_n)$ norm as $t \to 0$, and

$$
\|F\|_p = \lim_{t \to 0} \|F(x; t)\|_p = \|F(x; 0)\|_p.
$$

They also showed that if $p = (n-1)/n$, then the nontangential limit exists for almost every $x \in E_n$.

The Littlewood-Paley $g$-function for the half-space is defined by

$$g(f)(x) = g(u)(x) = \left(\int_0^\infty t |\nabla u(x; t)|^2 \, dt\right)^{1/2},$$

$$g(F)(x) = \left(\frac{1}{n+1} \sum_{j=1}^{n+1} g^2(u_j)(x)\right)^{1/2}.$$
For the Lusin s-function, the cone inside the unit sphere is replaced by an open cone $W_\delta(x), 0 < \delta < \infty$, consisting of all points $(y; t)$ such that $|x - y| < \delta t$.

The Lusin s-function for the half-space is then defined by

$$s(f)(x) = s(u)(x) = \left( \int_{W_\delta(x)} \frac{|\nabla u(y; t)|^2}{t^{n-1}} \, dt \, dy \right)^{1/2},$$

$$s(F)(x) = \left( \frac{1}{n+1} \sum_{j=1}^{n+1} s^2(u_j(x)) \right)^{1/2}.$$

It is known [12, pp. 447, 462] that, for any $u(x; t)$ harmonic in $t > 0$, $g(u)(x) \leq A_\delta s(u)(x)$, and so

$$g(f)(x) \leq A_\delta s(f)(x), \quad g(F)(x) \leq A_\delta s(F)(x). \tag{6.1}$$

We now state the half-space analogues of Lemma 5 and of Theorems 1 and 2.

**Lemma 9.** Suppose that $F \in H^p(\mathbb{R}_+ \times (0, \infty)), (n-1)/n < p < \infty$, and let

$$N(F)(x) = N_\delta(F)(x) = \sup \{|F(y; t)| : (y; t) \in W_\delta(x)\}.$$

Then

$$\|N(F)\|_p \leq A_{p,\delta}\|F\|_p.$$  

**Theorem 3.** If $F \in H^p(\mathbb{R}_+ \times (0, \infty)), (n-1)/n < p < \infty$, then $\|g(F)\|_p \leq A_p\|F\|_p$ and $\|s(F)\|_p \leq A_{p,\delta}\|F\|_p$.

**Theorem 4.** If $f \in L^p(\mathbb{R}_+), 1 < p < \infty$, then $\|g(f)\|_p \leq A_p\|f\|$ and $\|s(f)\| \leq A_{p,\delta}\|f\|$.

Lemma 9 is an immediate consequence of two lemmas which appear in [13, Lemmas (3.8) and (3.14)]. As was mentioned in the introduction, Theorem 4 has been proved by Stein [12]. In §7, we shall show how Lemma 1 may be employed in order to obtain Theorem 3 for $(n-1)/n < p \leq 2$. Since the extension to $p > 2$ then proceeds in essentially the same way as that used in §5 for the unit sphere, we shall not present it. The case $p > 1$ of Theorem 3 may also be obtained by applying Theorem 4 to each component of $F$.

It should be noted that we may obtain a new proof of Theorem 4 for $1 < p \leq 2$ by proceeding along the same lines as in the proof of Theorem 3, replacing $F$ by $f$ and the various lemmas concerning systems of conjugate harmonic functions by the analogous lemmas for single harmonic functions.

7. **Proof of Theorem 3; case when $(n-1)/n < p \leq 2$.** In view of (6.1), it suffices to prove that

$$\|s(F)\|_p \leq A_{p,\delta}\|F\|, \quad (n-1)/n < p \leq 2. \tag{7.1}$$

Setting $F_\varepsilon(x; t) = F(x; t + \varepsilon), \varepsilon > 0$, and proceeding as in the proof of Theorem 1 given in §4 for $(n-2)/(n-1) < p \leq 2$, we find that it is enough to prove (7.1) with
In the proof $F(x; t)$ will denote $F_\delta(x; t)$.  For any two positive numbers $a$ and $b$, let $d = a + \delta b$ and
\[
h(x; t) = \frac{b}{\pi} \cos^2 \frac{\pi r}{2d} \sin \frac{\pi t}{b},
\]
where $r = |x|$.  We note that
\[
\lim_{a \to \infty} h(x; t) = \frac{b}{\pi} \sin \frac{\pi t}{b}, \quad \lim_{b \to \infty} \frac{\pi t}{b} = t,
\]
and $h(x; t) \geq 0$ whenever $0 \leq t \leq b$.  Put
\[
N(x) = \sup_{(y; t) \in \mathcal{W}_d(x)} |F(y; t)|, \quad W(x) = W_\delta(x), \quad W(x; b) = W(x) \cap \{(y; t): t \leq b\},
\]
\[
c = c(d) = \sup_{|x| \leq d} |F(x; t)|^2, \quad w(x; t) = w(F(x; t), p, a, b) = (|F(x; t)|^2 + c)^{p/2}.
\]
Then $0 < c(d) \leq N^2(x)$ and $w(x; t) \leq 2^{n/2} N^p(x)$ whenever $|x| \leq d$.  Letting
\[
S^2_n(x; a, b) = \int \int_{W(x; b)} h(y; t) \frac{h(y; t) \Delta w(y; t)}{t^n} \, dt \, dy
\]
and applying Lemma 1 with $n$ replaced by $n + 1$, it is easy to see that
\[
S^2_n(x; a, b) \leq A_p N^2 N(x) \int \int_{W(x; b)} \frac{h(y; t) \Delta w(y; t)}{t^n} \, dt \, dy
\]
whenever $|x| \leq a$.  Hence, using Hölder’s inequality,
\[
\int_{|x| \leq a} S^p_n(x; a, b) \, dx \leq A_p \|N\|_{\mathcal{L}^p}^{p/(2-p)^2} \left( \int \int_{W(x; b)} \frac{h(y; t) \Delta w(y; t)}{t^n} \, dt \, dy \, dx \right)^{p/2}.
\]
Now let $\chi_x(y; t)$ be the characteristic function of $W(x)$.  Then
\[
\int_{|x| \leq a} \int \int_{W(x; b)} \frac{h(y; t) \Delta w(y; t)}{t^n} \, dt \, dy \, dx
\]
\[
= \int_{|x| \leq a} \int_{|y| \leq d} \int_0^b \chi_x(y; t) h(y; t) \Delta w(y; t) \, dt \, dy \, dx
\]
\[
\leq A_\delta \int_{|y| \leq d} \int_0^b h(y; t) \Delta w(y; t) \, dt \, dy,
\]
since
\[
\int_{|x| \leq a} \chi_x(y; t) \, dx \leq \int_{E_n} \chi_x(y; t) \, dx = \int_{|x| \leq \delta t} \, dx = A_\delta t^n.
\]
Assuming temporarily that \( n \geq 2 \) and employing cylindrical coordinates, we have

\[
\int_{|x| \leq d} \int_0^b h(x; t) \Delta w(x; t) \, dt \, dx
\]

\[
= \int_{|x| \leq d} \int_0^b h(x; t) \frac{\partial^2 w}{\partial t^2} \, dt \, dx + \int_{|x| \leq d} \int_0^b h(x; t) \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial w}{\partial r} \right) \, dt \, dr \, d\theta
\]

\[
+ \sum_{j=1}^{n-1} \int_0^b h(x; t) \frac{\partial}{\partial t_j} \left( \frac{v}{v_j^2} \frac{\partial w}{\partial t_j} \right) \, dt \, dr \, dt_1 \cdots dt_{n-1}
\]

\[
= P_t + P_r + \sum_{j=1}^{n-1} P_{rj},
\]

where \( w = w(x; t) \), \( r = |x| \), \( x = r \theta \), and \( Q, d\theta, v, v_1, \ldots, v_{n-1} \) are as defined in \( \S 2 \).

Consider \( P_t \) first. Integration by parts with respect to \( t \) yields

\[
\int_0^b \sin \frac{\pi t}{b} \frac{\partial^2 w}{\partial t^2} \, dt = \left[ -\frac{\pi}{b} w \cos \frac{\pi t}{b} \right]_0^b - \left( \frac{\pi}{b} \right)^2 \int_0^b w \sin \frac{\pi t}{b} \, dt \leq \frac{A_p}{b} N^p(x)
\]

together with \( |x| \leq d \), and so

\[
P_t \leq A_p \int_{|x| \leq d} N^p(x) \cos^2 \frac{\pi r}{2d} \, dx \leq A_p \| N \|^p_{L^p}.
\]

Considering \( P_r \), next, we find that

\[
\int_0^d \cos^2 \frac{\pi r}{d^2} \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial w}{\partial r} \right) \, dr \leq \frac{\pi^2}{2d^2} \int_0^d r^{n-1} w \, dr
\]

and so \( (dx = r^{n-1} \, dr \, d\theta) \)

\[
P_r \leq \frac{b \pi}{2d^2} \int_{|x| \leq d} \int_0^b r^{n-1} w \sin \frac{\pi t}{b} \, dt \, dr \, d\theta \leq \frac{b^2 A_p}{d^2} \| N \|^p_{L^p} \leq A_{p,\theta} \| N \|^p_{L^p}.
\]

Now consider \( P_{rj} \). An integration with respect to \( t_j \) yields

\[
\int_{|x| \leq d} \int_0^b h(x; t) \frac{\partial}{\partial t_j} \left( \frac{v}{v_j^2} \frac{\partial w}{\partial t_j} \right) \, dt_1 \cdots dt_{n-1} = 0, \quad j = 1, 2, \ldots, n-1,
\]

because

\[
\sin^{n-1-j} t_j \frac{\partial w}{\partial t_j} \bigg|_{t_j=\pi}^\tau_{t_j=0} = 0, \quad j < n-1
\]

and, due to periodicity,

\[
\left[ \frac{\partial w}{\partial t_{n-1}} \right]_{t_{n-1}=0}^{t_{n-1}=2\pi} = 0.
\]

Therefore, \( P_{rj} = 0, j = 1, 2, \ldots, n-1 \).

Combining these estimates, we find that

\[
\int_{|x| \leq d} \int_0^b h(x; t) \Delta w(x; t) \, dt \, dx \leq A_{p,\theta} \| N \|^p_{L^p}.
\]
If we now let $a$ and $b$ approach $\infty$ and apply Fatou's lemma, then it follows from (7.2), (7.3), (7.4), and Lemma 9 that

$$\|s(F)\|_p \leq A_{p,\delta} \|N\|_p^{(2-p)/2} \|N\|^{p/2} \leq A_{p,\delta} \|F\|_p,$$

which is the desired result. For $n=1$, we use the cartesian form of $\Delta$ and proceed as above.

**REMARKS.** A simpler proof yields Theorems 2 and 4 for $1<p \leq 2$. A decomposition of $f$ into its positive and negative parts reduces the problem to nonnegative functions. Then $u$, the Poisson integral of $f \geq 0$, is strictly positive and so in place of Lemma 2 we may use the identity

$$(7.5) \quad \Delta(u^2) = \frac{2}{p(p-1)} u^{2-p} \Delta(u^p)$$

in which, since $u>0$, no singularities appear.

We note also that Theorems 1–4 may be obtained for $p \geq 4$ by using a standard conjugacy argument to pass from the case $1<p \leq 2$ to $p \geq 4$ (see Stein [12, p. 455] and Zygmund [17, Vol. II, p. 212]).

**Added.** E. M. Stein [Intégrales singulières et fonctions différentiables de plusieurs variables (Notes), Faculté des Sciences d'Orsay, 1967] has independently utilized the identity (7.5) to obtain Theorem 4 and the analogous result for the function $g_\#^p(f)$ of Littlewood-Paley and Zygmund. Also, in *Classes $H^p$ et multiplicateurs: Cas n-dimensionnel* [C. R. Acad. Sci. Paris 264 (1967); Série A, 107–108, Proposition 2] he announced (without proof) the corresponding $H^p(E_n \times (0, \infty))$, $p > (n-1)/n$, result for the function $g_\#^p(F)$ (Stein denotes it by $S_\#^p(F)$). It is not difficult to see that Stein's Proposition 2 and the corresponding results for the class $H^p(\Sigma)$ and the $H^p$ class constructed by Muckenhoupt and Stein [9, p. 45] can be obtained by the method introduced in this paper.
